Since the first discoveries of the virus in human beings in the late 20th century in the US as well as on the African continent, its real origin has not yet been determined and most importantly, a cure could not be developed until today. Research has made enormous progress though and has enabled infected people to extend their life expectancy after the illness' out-break up to twenty years with the help of antiretroviral medication. But still, the disease remains a 'killer disease,' since yet incurable and thus ultimately uncontrollable for human beings and their otherwise advanced and sophisticated medical science. The uncertainty HIV/AIDS creates...
